

## Leave Management:

### **Defect-1: No Confirmation Message on Approve/Reject Actions in Leave Management Page.**

**Description:** In the Leave Management Page, when the user clicks on the Approve or Reject buttons for leave requests, no confirmation message or feedback is displayed. The action may be performed in the backend, but the user receives no indication of success or failure, leading to confusion.

#### **Steps to Reproduce:**

1. Navigate to the Leave Management Page.
2. Click on either the Approve or Reject button for a leave request.
3. Observe that no success, error, or confirmation message is shown.

#### **Expected Result:**

After clicking Approve or Reject, the system should:

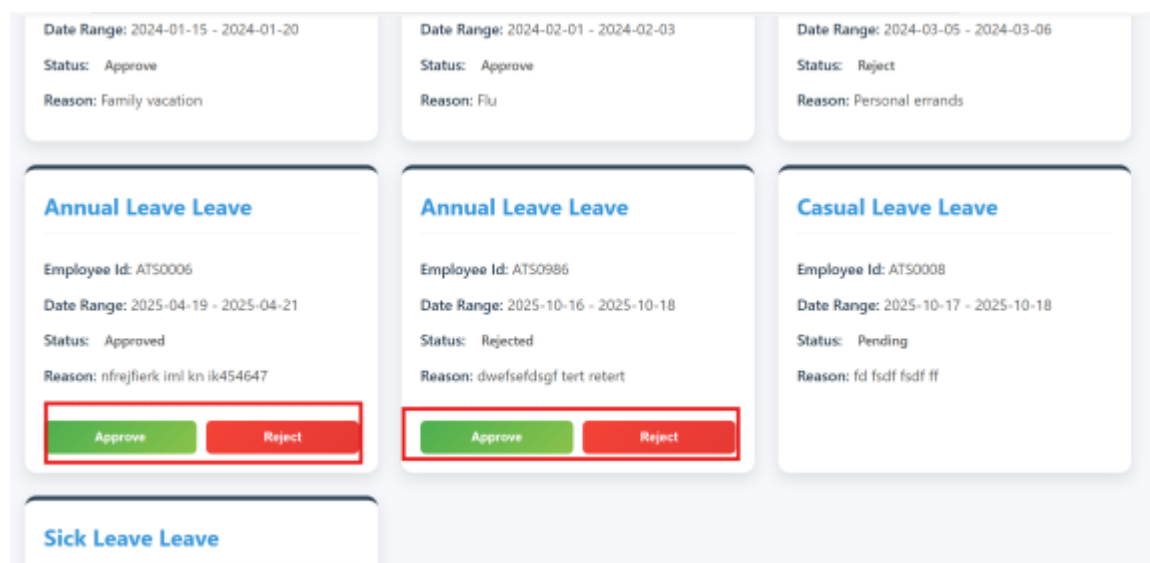

Show a success message (e.g., "Leave request approved successfully").

Optionally display a confirmation dialog before taking action (e.g., "Are you sure you want to approve this leave?").

#### **Actual Result:**

No visual feedback or confirmation is shown after the button is clicked. The user is unsure if the action was completed or if an error occurred.

### **Defect-2: Approve/Reject Buttons Not Disabled After Action – Status Not Updating Immediately in Leave Management Page.**

**Description:** On the Leave Management Page, after clicking Approve or Reject, the following issues are observed:

The buttons remain visible and clickable, allowing repeated approvals/rejections.

The leave status does not update immediately in the UI.

Status only updates after a manual page refresh.

This results in users being able to perform the same action multiple times, which can lead to inconsistent or duplicate records.

**Steps to Reproduce:**

- 1. Navigate to the Leave Management Page.
- 2. Click on Approve or Reject for a leave request.
- 3. Observe that:
- 4. The buttons remain active (not grayed out or hidden).
- 5. No immediate status change occurs.
- 6. The same action can be repeated multiple times.
- 7. Refresh the page and observe that the status is updated and buttons are reset.

**Expected Result:**

Once an action is taken (Approve/Reject):

The buttons should be disabled or hidden immediately.

The status of the leave request should update without requiring a page refresh.

The system should prevent repeated actions on the same request.

**Actual Result:**

Buttons remain visible and active after action.

Status does not update until manual refresh.

Users can click Approve/Reject multiple times, leading to inconsistent backend data.
